Preface

Thank you for purchasing a KOUKAAM product. Before usage, please, carefully read these Operating Instructions and the Quick Installation Guide, which is included in the package. You thus forego erroneous installation or incorrect usage of the device.

Carefully read the following notice. The device you have purchased operates under a certain voltage. Incorrect manipulation with the device may result in damage to the device or injury to the person handling it.

Important notice

1. The manufacturer is not liable for potential damage caused by incorrect usage or placing the device in an unsuitable environment.
2. The device is not intended for usage outdoors.
3. Do not use the device in an environment with strong vibrations.
4. If the device malfunctions, contact your vendor.
5. Unauthorised modification of this device can damage it or cause fire.
6. Prevent contact with fluids; do not expose the device to high temperatures.
7. Protect the device from falling.
8. Only devices approved for use in the electricity network may be connected.
9. If the device malfunctions, disconnect it from the electric power supply and contact your vendor.

1. Introduction

The **NETIO-230B** is a multifunctional power supply controller. This device is intended to control power supply via web interface, telnet, or CGI commands. Thanks to the network administration technology based on IP protocol basis, the user can control or provide a power supply to a connected external device (appliance) via a computer connected to the LAN or Internet network. No special software is necessary to control the device, the Web interface is already integrated in the firmware. Using the web interface, you can easily control and set the entire device and individual outputs.

Imagine that you are travelling around the world and you can directly or via a timer control the power supply to your electrical appliances, such as, computers, servers, routers, electric gates, security/surveillance system or any appliance.

1.1. Characteristics

- Integrated web server
- Support for a broad spectrum of browsers:
 - Internet Explorer
 - Mozilla Firefox
 - Opera
 - Google Chrome
- Four controllable ports
- Four manual control buttons
- Support for HTTP, SMTP, SNTP, DHCP, DNS, Telnet protocols
- Control using CGI commands
- Possibility to login using an encrypted password
- User authorisation
- LED indication of the actual state of each port
- Safe anti-electric shock design, fire-resistant materials
- Time control - you can set the on/off time for the requested port
- Default setting of port state after switch-on and restart of the device
- Watchdog function for resetting of a blocked network device
- E-mail notification
- Over-voltage protection on the entire device and all the four outputs

1.2. Specifications

Power supply voltage:	230 V AC
Maximum switched current:	10 A
Dimensions:	300 × 60 × 90 mm (h × w × d)
Network interface:	1x RJ-45 10/100 Mbit/s

1.3. Minimum system requirements

- Computer with Internet browser (Microsoft Internet Explorer, Opera, Mozilla Firefox, ...) with JavaScript support enabled.

2. Equipment interface

2.1. Front view

Figure 2.1. Front view

1. Controlled power supply outputs 230V
2. Four indicator LED diodes
3. Manual buttons for switching outputs on/off
4. Power supply cable 230V

2.2. Side view

Figure 2.2. Side view

1. Fuse holder for main fuse, 10A
2. Main Switch

3. Connector RJ-45 network interface for connection to Ethernet/Internet.

3. Installation

Before using the device for the first time, check whether the power supply voltage setting is 230 V AC.

3.1. Connection of the device

1. Connect the NETIO-230B to the network (switches, router) using the network cable with RJ-45 connectors.
2. Connect the NETIO power supply cable to the socket.
3. Connect the device, which you want to control, to the appropriate output.
4. Switch on the NETIO-230B using the switch on the side of the device.

4. Initial configuration

1. On the enclosed CD, you will find the file **NetioDiscover.exe**, execute it.
2. Click the button **Discover**. This lists all the accessible NETIO devices in your network.
3. Select the device from the list and click the button **Device setup**.

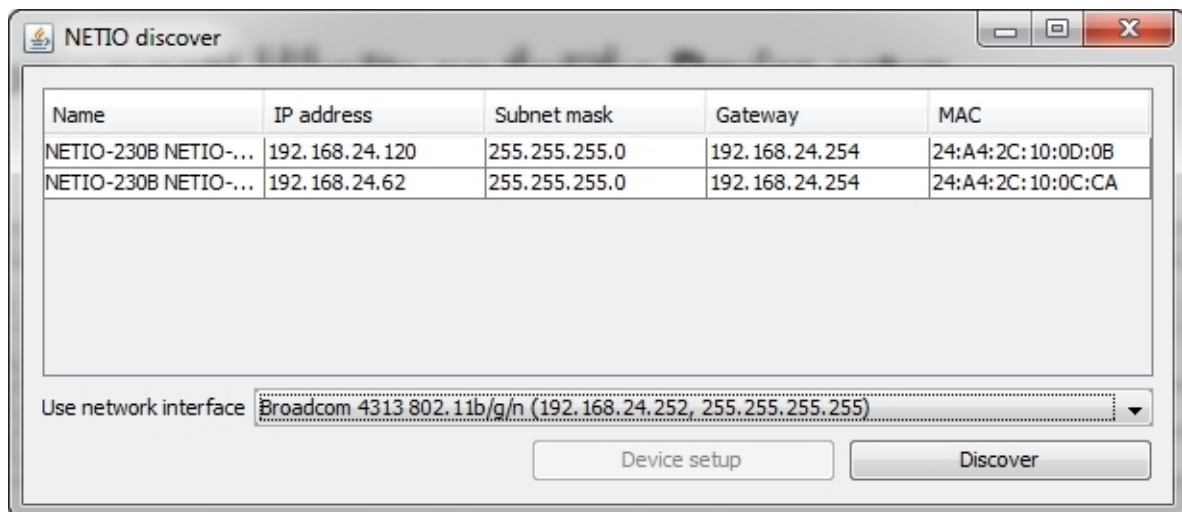

Figure 4.1. Devices found

The configuration window appears - **IP address**, **Subnet mask** and **Gateway IP Address**.

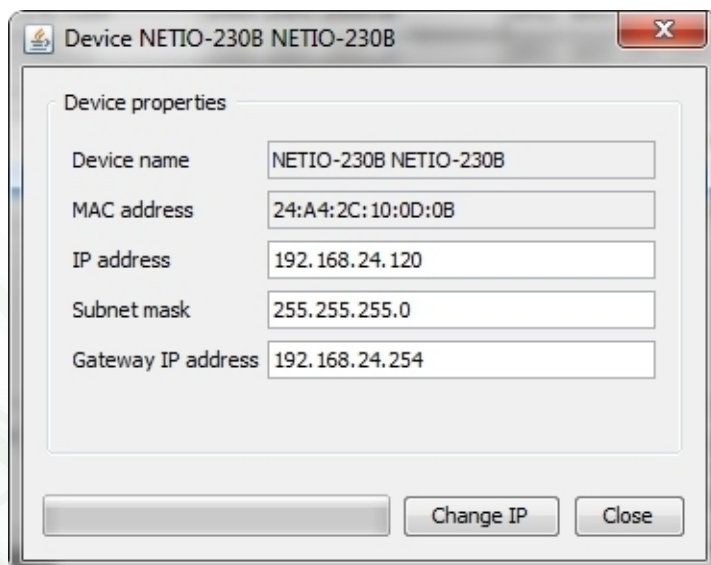

Figure 4.2. Configuration of the device

After editing the network configuration parameters, click the button **Change IP**, which saves the configuration and restarts the device. **If you have a DHCP server in the network and you do not want to change the network settings, you can skip the manual setting and continue to the next step.**

The default IP address of the device is **192.168.10.100** if you do not have a DHCP server in the network. If you have, the device gets the address from the DHCP server.

4. You access the web interface of the device either by entering the IP address into the Internet browser, or by double-clicking the IP address of the device in **NETIO discover**.
5. The login page is displayed. Enter the **User Name**, **Password** and click the **OK** button. You access the device page.

The default username is: **admin**, the password is: **admin**.

The image shows a web browser window displaying the login page for the NETIO-230B device. The page has a green header with the text "NETIO-230B". Below the header, the title "NETIO-230B WebControl" is centered. A message "Please enter user name and password." is followed by a note: "NOTE: JavaScript must be Enabled." There are two input fields: "Username" and "Password". Below these fields are two buttons: "OK" and "Cancel".

NETIO-230B

NETIO-230B WebControl

Please enter user name and password.
NOTE: JavaScript must be Enabled.

Password

OK Cancel

Figure 4.3. Login screen

To login to the web interface, it is necessary to have JavaScript support enabled in the browser.

5. Control and configuration

5.1. Control and configuration of the outputs

5.1.1. Control of outputs

In the left section of the window, click **Manual Control**. The page containing the individual output controls is displayed.

Outputs	Name	No.	Manual	Status	Interrupt
Manual control	output_1	1	<input checked="" type="checkbox"/>	<input checked="" type="radio"/> ON <input type="radio"/> OFF	<input type="checkbox"/>
Status & configuration	output_2	2	<input checked="" type="checkbox"/>	<input checked="" type="radio"/> ON <input type="radio"/> OFF	<input type="checkbox"/>
System	output_3	3	<input checked="" type="checkbox"/>	<input type="radio"/> ON <input checked="" type="radio"/> OFF	<input type="checkbox"/>
Configuration	output_4	4	<input checked="" type="checkbox"/>	<input type="radio"/> ON <input checked="" type="radio"/> OFF	<input type="checkbox"/>

Apply All off

Figure 5.1. Manual control of the outputs

NETIO-230B can control all four outputs simultaneously. Select the output, which should be activated or deactivated and click **Apply**. If you only want to restart the device connected to the given output, select the field **Interrupt** and click **Apply**. The output is deactivated for the period set in the menu **Status & configuration** in the field **Interrupt delay** and then restarted. Short-term interruption of the output can be used only on an active output. If you want to manually activate/deactivate the given output, or restart it, check whether the output's **Manual** field is selected. If the field is not selected, the device does not accept the manual commands and functions in time switching and *watchdog* mode. The button **All off** is used for switching off all active outputs.

5.1.2. Configuration of output parameters

Click **Status & configuration** in the left part of the window and a list of outputs and information about their current state appears in the window on the right side.

Outputs	Select	Name	No.	Mode	Status	Watchdog
Manual control	<input checked="" type="radio"/>	output_1	1	TIMER	ON	NO
Status & configuration	<input type="radio"/>	output_2	2	TIMER	ON	NO
System	<input type="radio"/>	output_3	3	MANUAL	OFF	NO
Configuration	<input type="radio"/>	output_4	4	MANUAL	OFF	NO

Figure 5.2. Configuration of output parameters

To set a specific output, select the desired output in the column **Select** and click the button **Modify**.

On the form that subsequently opens, you can set the detailed parameters of the selected output. The meaning of the individual parameters is described in the following text.

Configuration of output

No.:	1
Name:	output_1
PON state:	<input checked="" type="checkbox"/> (default output state after power on)
Manual control:	<input checked="" type="radio"/>
Timer control:	<input type="radio"/>
Timer mode:	ONCE
ON time:	1970 - 01 - 01 00 : 00 : 00
OFF time:	1970 - 01 - 01 00 : 00 : 00
Week schedule:	<input type="checkbox"/> Mon <input type="checkbox"/> Tue <input type="checkbox"/> Wed <input type="checkbox"/> Thu <input type="checkbox"/> Fri <input type="checkbox"/> Sat <input type="checkbox"/> Sun
Interrupt delay (s):	5
WATCHDOG	
Enable:	<input type="checkbox"/>
IP address:	0 . 0 . 0 . 0
Timeout (s):	9 (ping command timeout)
PON delay (s):	60 (time for which the Watchdog will be inactive after the output restarts)
Ping interval (s):	3 (interval between ping commands)
Max retry:	3 (how many times should be the output restarted)
Retry POFF:	<input type="checkbox"/> (keep the output OFF after Max retry limit is reached)
Send e-mail:	<input type="checkbox"/>
<input type="button" value="Apply"/>	

Figure 5.3. Configuration of output

No.:	Output Number (1-4)
Name:	Output Name
PON state:	port state upon switching on the device - if you select the field, the output is activated after start or restart of the device
Manual control:	enables manual control of the output, deactivates automatic timer control. This choice has no influence on the Watchdog function.
Time control:	if you select this item, the output will be switched by a timer, whose setting is outlined below

Timer mode:	timer mode sets the frequency of the switch-on/switch-off. The options are: ONCE the event occurs only once, DAILY the event is repeated every day or WEEKLY the event is repeated only on the days selected in the "Week Schedule" field.
ON time:	date and time port switched on, if you select the DAILY mode, this will be the date and time of first switch-on
OFF time:	date and time port switched off, if you select the DAILY mode, this will be the date and time of first switch-off
Week schedule:	The selection that determines the days of the week on which the Timer function is active if you have selected WEEKLY in the Timer mode field.
Interrupt delay:	time (in seconds) over which the port will be off when using the Interrupt function in the manual setting of the port, or when using Watchdog function

Watchdog

The **watchdog** function is used to monitor the operation of the device in the network. If the monitored device does not respond to ping queries within a given interval, the output for which this function is set is deactivated for a given period and then reactivated. To restrict continuous switching of the port in case of failure of the monitored device, it is possible to set the maximum number of restart attempts for a given port.

Enable:	enables the watchdog function
IP address:	IP address of the network device to be monitored
Timeout:	maximum response time of the monitored device to a ping
PON delay:	time interval (in seconds) over which the Watchdog function will not be active after an output restarts. During this period, the monitored device should start operating after a restart.
Ping interval:	interval (in seconds) in which ping queries will be sent to the device
Max retry:	maximum number of port restart attempts if the monitored device does not respond to the ping commands. After expiry of the given number of attempts, the port remains inactive.
Retry POFF:	activation of Max retry function
Send e-mail:	send e-mail information if the monitored device did not respond and was restarted

Click the **Apply** button to save the setting.

5.2. System configuration

Here, the user can set the network parameters, e-mail, system time, manage user accounts and install new firmware on the device.

5.2.1. Configuration of network parameters

Upon clicking the **Configuration** button, the system configuration page is displayed. Here, you can set the **IP address**, **Subnet mask**, **Default gateway** and **DNS server** according to your network parameters. If you do not want to use manual configuration of the network, you can switch the **DHCP** by selecting **Enable**, and the device automatically sets the parameters according to the **DHCP** server.

NETIO-230B System configuration

Outputs	DHCP: <input type="radio"/> Enable <input checked="" type="radio"/> Disable
Manual control	DHCP hostname send: <input checked="" type="checkbox"/> (use device name as hostname)
Status & configuration	SNTP from DHCP: <input checked="" type="checkbox"/> (set SNTP server from DHCP)
System	IP address: 192 . 168 . 200 . 84
Configuration	Subnet mask: 255 . 255 . 255 . 0
E-mail	Default gateway: 192 . 168 . 200 . 1
Date & time	DNS server: 192 . 168 . 200 . 224
Manage users	Switch delay (x0.1s): 2 (delay between triggering two outputs)
Firmware Update	KSHELL Port: 1234
Logout	WEB Port: 80
Device name	CGI compatibility: <input type="checkbox"/> (compatibility with previous versions)
netio-230B	Device name: NETIO-230B
Logged user	Firmware Version: V 3.11
admin	<input type="button" value="Apply"/> <input type="button" value="Reset to factory default"/>
Time	Note 1: After you make requested changes on this page and click Apply the device will change the parameters and restart automatically. After the restart you will have to login again.
2012-01-08 08:53:49	Note 2: Any of Network value change cause system restart.

Figure 5.4. Configuration of the network

DHCP:	DHCP on/off. When DHCP is off, it is possible to change the parameters manually.
DHCP hostname send:	enables sending of device name to DHCP server.
SNTP from DHCP:	enables automatic setting of the server for synchronisation of time according to the address set on the DHCP server.
Switch delay (x0.1s):	determines the time period between triggering two outputs. This delay is set to protect the device from overload upon switching on all outputs simultaneously .
KSHELL Port, WEB Port:	makes it possible to change the default output for access via telnet, or to the web interface of the device.
CGI compatibility:	activates the compatibility mode with CGI command format in preceding NETIO-230A (up to fw v2.33) and NETIO-230B (up to fw v3.0) devices. The compatibility mode does not permit input of multiple commands to one CGI. Usage of the compatibility mode is not recommended for security reasons.

Device name: in this field, you can name your device for easier identification later. When **DHCP hostname send** is selected, this value is sent to the DHCP server.

Firmware version: shows the currently installed firmware version.

If you edit this page, click **Apply** and the device changes the network parameters and restarts. After restart, you must login again. The button **Reset To Default** is used to reset the device to factory settings.

5.2.2. E-mail configuration

After clicking **Setup e-mail**, a form is displayed in the right side for setting the e-mail parameters.

Figure 5.5. E-mail configuration

From: this address will be shown in the messages as the sender's address.

To: messages will be sent to this address.

SMTP server: mail server, via which messages will be sent.

Message subject: used to enter the subject of sent messages. Enter the text that should be displayed in the e-mail message body.

Click **Apply** to save the settings. The button **Send test message** is used to send a test message.

Note: The current firmware version does not support SMTP authorization.

5.2.3. Time settings

Click **Date & time** in the menu to display the form for setting time in the right section.

The NETIO-230B supports three time setting methods. You enter the time, either manually or using the SNTP server for automatic time synchronisation, or time synchronisation with the local computer.

NETIO-230B **Date and time configuration**

Outputs	Uptime:	0 years 0 days 1 hours 13 min 11 sec	
Manual control	SNTP enable:	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	
Status & configuration	SNTP status:	Not Synchronized	
System	SNTP server:	<input type="text" value="tak.cesnet.cz"/>	
Configuration	Local time offset:	<input type="text" value="60"/> minutes	
E-mail	Daylight saving time:	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	
Date & time	Daylight saving time begin:	<input type="text" value="2012"/> - <input type="text" value="03"/> - <input type="text" value="25"/> <input type="text" value="02"/> : <input type="text" value="00"/> : <input type="text" value="00"/>

Figure 5.6. Setting the date and time

SNTP enable: activation of synchronisation with the SNTP server. When enabled, manual date/time setting is ignored.

SNTP status: displays the synchronisation state

Synchronized: time synchronised with SNTP server

Not Synchronized: synchronisation with SNTP server not completed

Local time offset: manual setting of time zone - time offset in minutes

Daylight saving time: Activation of summer time

Daylight saving time start: date and time of summer time start

Daylight saving time end: date and time of summer time end

Local time: manual setting of local time with deactivated synchronisation with SNTP server

Setting of the summer time and local time offset applies to both automatic setting and setting via SNTP. If you do not set *Local Time Offset* during synchronisation of time with the SNTP server, the default GMT 0 zone will be used.

Figure 5.7. Configuration of user accounts

Admin: user with full authorisation

User: user that can control the ports, but cannot change system settings

Guest: user that does not have the rights to change any settings and can only see the current state of the ports

As required, select one of the above options. You can change the user account settings in the following categories.

Add: add a new user

Modify: change the password and user authorisation of a selected user

Remove: remove selected user

5.2.5. Firmware update

The **Firmware Update** page is used to download new firmware into the NETIO device. The current firmware version may be found at http://www.koukaam.se/showproduct.php?article_id=1581

Upon clicking the item **Firmware Update**, a red frame is displayed in the window on the right side with the notice:

After pressing the Update button, please, wait for completion of the process. After the update process is completed, the device will reboot automatically. You can re-login afterwards.

Figure 5.8. Warning prior to firmware update

To continue, click the **Update** button, the device jumps to firmware download mode. After about three seconds, the **Continue** button is activated. Click on it.

Figure 5.9. Restart before update

Now insert the firmware file with suffix **.bin** and click **Update**. Download of the new firmware takes about 2 minutes. After completion of the update, the device restarts. After re-logging, you will work with the new firmware version.

The image shows a web browser window titled "NETIO-230B Firmware Update". It contains a form with a label "New Firmware (*.bin):" followed by a text input field. To the right of the input field is a button labeled "Procházet...". Below the input field is a button labeled "Update". At the bottom of the form, there is a warning message: "Firmware Update can take about one minute and must NOT be interrupted !".

NETIO-230B Firmware Update

New Firmware (*.bin):

Firmware Update can take about one minute and
must NOT be interrupted !

Figure 5.10. Call to download new firmware file

5.3. Control of the device via Telnet or CGI

5.3.1. Encrypted login

For login with secure password, you must first get the hash code from the device. You get this either in the return code after connection via KShell or the CGI command hash. For calculation, the MD5 sum is used that has been calculated as the following sum <name><password><hash>. This is a 128b number (32 characters) transmitted in a hexadecimal format.

5.3.2. Communication via KShell interface

The connection procedure is shown in the following example:

1. Open the window with command line
2. Enter the command **telnet 192.168.10.100 1234** (enter the address after the address of your device, will 1234 with the port, which you have set for KShell on the device)
3. The device should list a response similar to the following: **100 HELLO EB5D61F6**. The last 8 characters comprise the hash string used for encrypted login.
4. Now you can login with the command:

login name password

where **name** is the username and **password** is your password. If you have entered the correct username and password, the device response is **250 OK**. You are now logged on and you can control the NETIO device using the commands from the following chapter.

Every communication session via KShell interface has limited validity. In case of inactivity of approximate duration one minute, the session will be terminated automatically. If you need to keep the session active, you can use the command **noop**.

5.3.3. Overview of KShell control commands

login <name> <password>

User login with password in open format. Example: Using the command **login admin admin** you log in with the user name **admin** and password **admin**.

cllogin <name> <crypted_password>

Login of user with crypted password.

version

Lists the firmware version.

alias

Lists the device name.

quit

Logout. In case of changes to the system settings, device restart is done.

reboot

Logs out, terminates the connection and restarts the device.

noop

Function for maintenance of the connection, no operation is executed.

uptime

Displays the time from the last start/restart.

port <output> [0 | 1 | manual | int]

Listing and setting of output state:

- if you enter only the name of the output without the parameter, the output state is listed (0 - off / 1 - on)
- output number with parameter **0/1** - switches the output on/off
- output number with parameter '**manual**' - switches output to 'manual' control
- output number with parameter '**int**' - interrupts the output

Example: The command **port 2 1** activates output number two.

port list [xxxx]

- without parameter lists the state of all ports
- xxxx is a command for control of all ports simultaneously - in place of **x** enter the commands:
 - 0 deactivate output
 - 1 activate output

- i call interruption of a given output
- u leave output unchanged

Example: The command **port list 01ui** deactivates output 1, activates output 2, leaves output 3 unchanged and interrupts output 4.

port setup <output> [<output_name> <mod: manual | timer> <interrupt_delay> <PON_status>]

Command for setting output parameters - the significance of the parameters is as follows:

<output_name> - Entered in quotation marks (it is possible to omit the quotation marks if it does not contain whitespaces)

<mod: manual | timer> - Selection of output mode.

<PON status> - State after switching on: 0 - off / 1 on

Example: The command **port setup 1 "output 1" manual 2 1** sets output 1 name of output 1, activates manual control, sets the interruption time to 2 seconds and sets the status upon switch on to on.

port timer <output> <time_format> [<mode: once | daily | weekly> <on-time> <off-time>] <week_schedule>

Timer settings:

<output> - number of the output being set

<time_format> - set time format

t:	HH:MM:SS
dt:	YYYY/MM/DD,HH:MM:SS
ux:	xxxxxxxx (unsigned long with prefix 0x<hex>, 0<octal> or decimal)

<mode once | daily | weekly> - Selection of timer mode.

<on-time> - Outlet on time.

<off-time> - Outlet off time.

<week schedule> - a series of ones and zeros; the first number is Monday, the last is Sunday

Example: The command **port timer 3 t weekly 08:00:00 17:30:00 1111100** switches the timer on at output 3. From Monday to Friday, output 3 will always be switched on at 08:00 and switched off at 17:30.

port wd <output>

Lists the setting of the watchdog function for the given output in the format:

**<wd: enable | disable> <wd_ip_addr> <wd_timeout> <wd_PON_delay>
<ping_refresh> <max_retry> <max_retry_poff: enable | disable> <send
email: enable | disable>**

port wd <output> <wd: enable | disable>

Permits or forbids the watchdog function.

Example: The command **port wd 4 enable** activates the watchdog function on output 4

port wd <output> <wd: enable | disable> <wd_ip_addr> <wd_timeout> <wd_PON_delay> <ping_interval> <max_retry> <max_retry_poff: enable | disable> <send_email: enable | disable>

Watchdog setting command. The significance of the parameters is as follows:

<output> - number of the output you are setting

<wd: enable | disable> - enable/disable watchdog function on a given output

<wd_ip_addr> - IP address of the monitored device in seconds

<wd_timeout> - maximum response time of the monitored device

<wd_PON_delay> - time interval (in seconds) over which the *Watchdog* function will not be active after output restart. During this period, the monitored device should start operating after restart.

<ping_interval> - interval (in seconds) in which queries will be sent to the device

<max_retry> - maximum number of output restart attempts if the monitored device does not respond to the ping commands. After expiry of the given number of attempts, the output remains inactive.

<max_retry_poff: enable | disable> - on/off function **max_retry**

<send_email: enable | disable> - on/off of e-mail message transmission at the moment of unavailability of the monitored device or upon overrun of the value **max_retry**

Example: The command **port wd 2 enable 192.168.10.101 10 30 1 3 enable enable** permits the watchdog function on output 2. The device at the address 192.168.10.101 will be monitored. The maximum response time of the monitored device will be 10 seconds. The ping commands will be sent at one-second intervals. If the monitored device does not respond within 10 seconds, output 2 is switched off for 30 seconds. If the device will not respond to ping commands after set switch-off three times in a row, the output is switched off for the fourth time and remains off. A warning e-mail message will be sent to you each time the output is switched off.

system eth

Lists the network interface settings in the format: **<dhcp | manual> <ip_address> <mask> <gateway>**

system eth <dhcp | manual> [<ip_address> <mask> <gateway>]

Sets the network interface - IP address, network mask and gateway are set only if the manual parameter is selected. For the changes to take effect, it is necessary to either restart the system with the command **reboot**, or switch the NETIO off/on.

Example: The system command **eth manual 192.168.10.150 255.255.255.0 192.168.10.1** sets the network address **192.168.10.150**, network mask **255.255.255.0** and default gateway to **192.168.10.1**.

email server <ip | domain_server_address>

Sets the IP address, or domain name of the SMTP server.

system discover <enable | disable>

Enables/disables network parameter settings from the discover utility.

system discover

Lists whether the system discover selection is enabled, or disabled.

system swdelay <delay>

Sets the delay time between the connection of two ports. The value is given in decimal seconds.

system swdelay

Lists the delay time between the connection of two ports.

system dns <ip>

Sets the IP address of the DNS server. For the changes to take effect, it is necessary either to restart the system using the **reboot** command or switch the NETIO off/on.

system dns

Lists the set address of the DNS server.

system sntp

Lists the settings of the SNTP client.

system sntp <enable | disable> <sntp_ip | domain>

SNTP client settings. Enables, or disables time synchronisation with the SNTP server. The address of the server can be entered as an IP address, or domain name.

system time <YYYY/MM/DD,HH:MM:SS>

Local time settings.

system time

Lists the local time in the format YYYY/MM/DD,HH:MM:SS.

system timezone <+ | -offset>

Local time zone settings. Time offset is given in seconds.

system timezone

Lists the time offset from UTC for local time. The value is listed in seconds.

system reset

Reset device to factory settings. After posting this command, the factory setting is restored and the system restarts.

system webport <port>

Sets the device web port. The default value is 80.

system webport

Lists the device web port.

system kshport <port>

Sets the kshell interface port.

system kshport

Lists the kshell interface port. The default value is 1234.

system dhcp

Lists the DHCP client parameter settings.

system dhcp hostname <enable | disable>

Enables posting of device name to DHCP server.

system dhcp sntp <enable | disable>

Enables setting of the SNTP server according to the address set on the DHCP server.

5.3.4. CGI control

The NETIO-230B device can also be integrated easily into your applications using CGI commands.

CGI control of the device is executed by means of commands in the following format:

http://<IP address>/tgi/control.tgi?<command>&<command>

Replace the string **<IP address>** with your device IP address. The string **<command>** is an actual command.

CGI commands:**hash=hash**

Sending of a request for an encrypted login string. The command returns **<html> hash </html>**.

login=<plc>:<user name>:<password>

Login to the device. With the command **login=plain**, you select for unencrypted login. For encrypted login, select the command **login=crypted**. Other command parameters are the username and password.

The returned values are described in chapter 5.3.6 – „Returned values for KShell, CGI and the serial line Section 5.3.5, “Return values for KShell and CGI”. In case of usage of CGI commands, the return value is enclosed in the HTML tags **<html>** and **</html>**.

quit=quit

Logout from the system. The return value is **<html>110 BYE</html>**. This command can be used only in CGI compatible mode with older devices.

port=<list|xxxx>

The parameter list - lists the output state in the format **<html> port1 port2 port3 port4 </html>**, where **port1** to **port4** are values **0** for output off and **1** for output on. The parameter **xxxx** is a string for setting the port. In place of the symbol **x** enter **0**, **1**, **u** or **i** just as applies to port setting via Telnet.

All commands can be shortened to individual symbols. For example, the command **port=list** can be shortened to **p=l**. The commands can be joined in a string using the symbol **&**.

Example:

http://192.168.200.84/tgi/control.tgi?login=p:admin:admin&p=10ui

This command executes login to the device at the address **192.168.200.84** with username **admin**, password **admin** and sets the output. It switches on output 1, switches output 2 off, leaves output 3 in actual state and interrupts output 4 for the time set in the actual setting of the output.

5.3.5. Return values for KShell and CGI**100 HELLO <hash>**

Device response after connection. Hash after HELLO can be used for encrypted login.

110 BYE

You have been logged off.

120 Rebooting....

Restarting

130 CONNECTION TIMEOUT

Connection time-out.

250 OK

Command executed successfully. The value returned by the called command may follow.

500 INVALID VALUE

Incorrectly entered value.

501 INVALID PARAMETER

Incorrectly entered parameter.

502 UNKNOWN COMMAND

Incorrectly entered or unknown command.

503 INVALID LOGIN

Incorrectly entered username or password.

504 ALREADY LOGGED IN

You are already logged in.

505 FORBIDDEN

You are not authorised to execute the given command. Log in as user with higher authorization.

506 INPUT LINE TOO LONG

You have sent an input line that is too long. Shorten the command and repeat the action.

507 TOO MANY CONNECTIONS

Maximum number of connections exceeded. Wait for someone to log-off. If inactive users are logged on, they will be disconnected automatically upon expiry of the time limit.

5.4. Manual control

Apart from control via PC, the device can also be controlled using the four buttons on the front panel. To switch the given output on or off, press the button for 2 seconds. If the output was off, it comes on, if it was on, on the contrary it goes off. The buttons correspond to the outputs 1-4, from left to right. The state of the individual ports is signalled by the green diode above the button for the given port that either switches on or off.

5.5. Status LED diodes

The status LED diodes on the device inform the user not only about the status of the output, but also provide him with some information about the status of the system.

The green LED diodes provide information about the actual status of the output. If diodes 1-4 are green, the individual outputs are on. If any of the concerned diodes is not green, this specific output is off.

The red LED diodes inform the user about different statuses of the entire device. The following states are possible:

Red LED 1 is on:	initialisation of network interface; if it remains on, the network is not available.
Red LED 2 is on:	posting of query to DHCP
Red LED 3 is blinking:	firmware update in progress
Red LED 4 is on:	device is in firmware update mode

5.6. Troubleshooting

5.6.1. Forgotten password. Reset to factory settings

If you forget your password, it is possible to reset to factory mode. This is done by pressing and holding buttons 1 and 2 with device on. Hold the buttons until the device beeps 2x. During the resetting process, all the LED diodes are red. As soon as reset is completed, the LED diodes go off.

5.6.2. Problem with update of firmware

If a problem arises during updating the firmware (e.g. power failures, or switching off the device before the update is completed), it is possible to force putting the device into operation in firmware update mode. You do this by pressing button 4 with device on. Hold the button until the device beeps. After this, connect to the device IP address via the browser. Continue to enter the firmware file as shown in the chapter which describes the firmware update process.

5.6.3. Changing the fuse

If the NETIO-230B stops working and no indication LEDs are not shining, it is possible that the fuse has been blown. Before actual replacement of the fuse, check to ensure that the NETIO-230C/CS **IS OFF** and **DISCONNECTED FROM THE POWER SUPPLY**. Also disconnect all the devices connected to the outputs. To replace the fuse, unscrew the fuse holder (ideally using a flat screwdriver). Always replace the fuse with a new fuse of same type (250V 10A, type F). After insertion of the correct fuse, replace the plastic holder and screw it into place. Connect the power supply cable and try to switch on the device. Before reconnecting all the devices to the outputs, check whether the fuse was not blown by a fault on the connected devices.

Conclusion

The manufacturer bears no responsibility for any technical or printing errors and reserves the right to make any changes in the product and in this user manual without prior notice. Any such changes will be announced via the manufacturer's website www.koukaam.se.

The manufacturer does not provide warranties of any kind whatsoever with regard to any information given in this user manual or any derived warranties regarding product saleability or fitness for a specific purpose.

In particular, the manufacturer does not provide any warranties for defects caused by incorrect use of the product, failure to abide by the instructions and recommendations stated in the user manual and for any defects caused by unprofessional activities of third parties outside the manufacturer's authorized service shop.

We believe that you will be satisfied with our product. In case of any questions or comments relating to the functionality of the NETIO product, please do not hesitate to contact us.

The company KOUKAAM a.s. represents that all products, software and other third party components used in this equipment were used by the company KOUKAAM a.s. on the basis of the relevant consent and pursuant to licence agreements between the company KOUKAAM a.s. and third parties. The company KOUKAAM a.s. reserves the right to change those licence terms and conditions, as the case may be, and such changes will be published in the updated version of a manual available on the website of the company KOUKAAM a.s. - www.koukaam.se
